ABSTRACT

A hair brush and method for using the same are disclosed. In various embodiments, the hair brush includes first and second brush heads pivotally coupled together. Each brush head can include bristles facing inwards toward the other brush head. Guide pins, longer than the bristles, can be disposed on the brush heads and can be used to guide the bristles deeper into the hair. In various embodiments, the guide pins are coated with ions that can inactivate and/or remove free radicals from the hair.
